

## **PSYCHOLOGY** exploring the mind

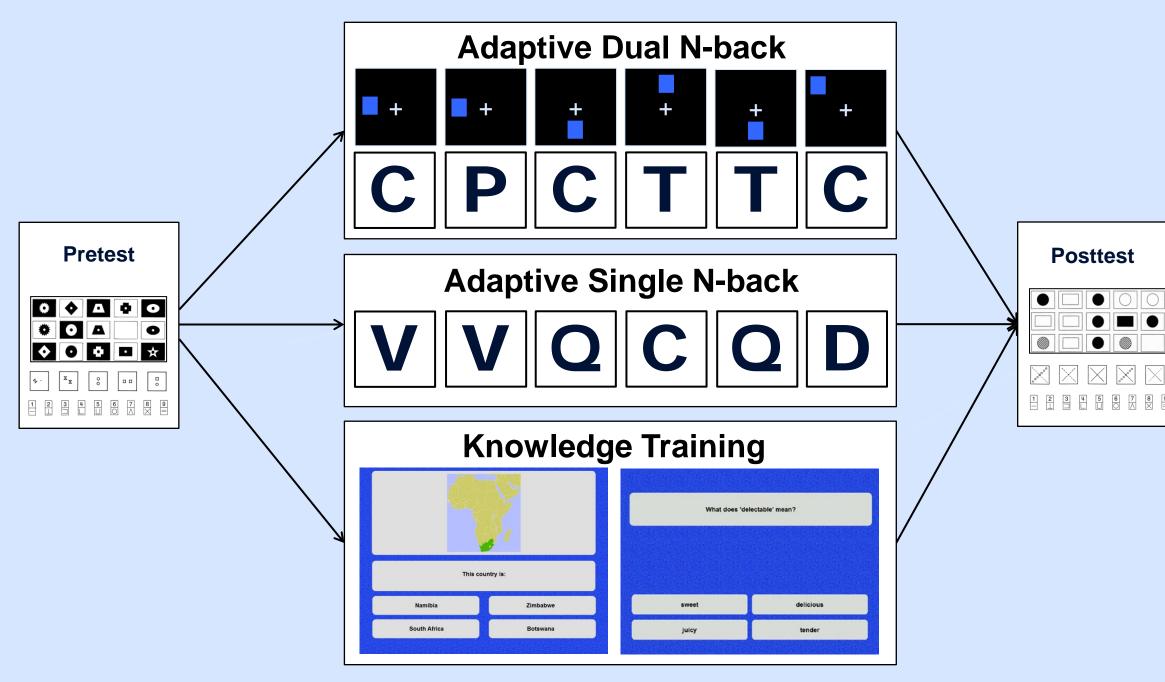

## Introduction

We were recently able to show that a 4-week long training intervention with an adaptive nback task leads to improvements in reasoning performance in healthy young adults (Jaeggi et al., 2008, 2010). In the current study, one group of participants trained on a dual n-back task (visuospatial and verbal material), whereas another group trained on a single n-back task (verbal material only). We investigated the extent of transfer in that we used multiple fluid intelligence (Gf) measures tasks which we combined into latent variables in order to investigate whether the effects we found previously are restricted to one specific test, or whether they can be regarded as more general. We compared the two experimental groups' gain in Gf with the gain of an active control group who trained on an intervention focusing on improving skills related to crystallized intelligence. We further assessed individual differences variables such as need for cognition and beliefs in intelligence to test whether those factors might mediate training or transfer.

## Method

*Participants*: We had 209 participants signing up for the study. 175 of those volunteered for participation in a "Brain Training Study" and did not receive any payment or course credit. 37 participants (21%) withdrew from participation after having completed one or two pre-test sessions (i.e., they never trained). 60 participants (34%) dropped out at some point during training, after having trained for 8.43 sessions on average (SD: 6.27; range: 1-20). The final group of participants which completed pre- and post-testing, as well as a minimum amount of 15 training sessions consisted of 78 participants (mean age: 25.21, SD: 6.46; range: 18-45; 36 women). Finally, 34 participants (mean age: 22.79; SD; 6.11; range: 18-44; 17 women) were recruited to take part in two paid baseline measurement sessions.

## Procedure

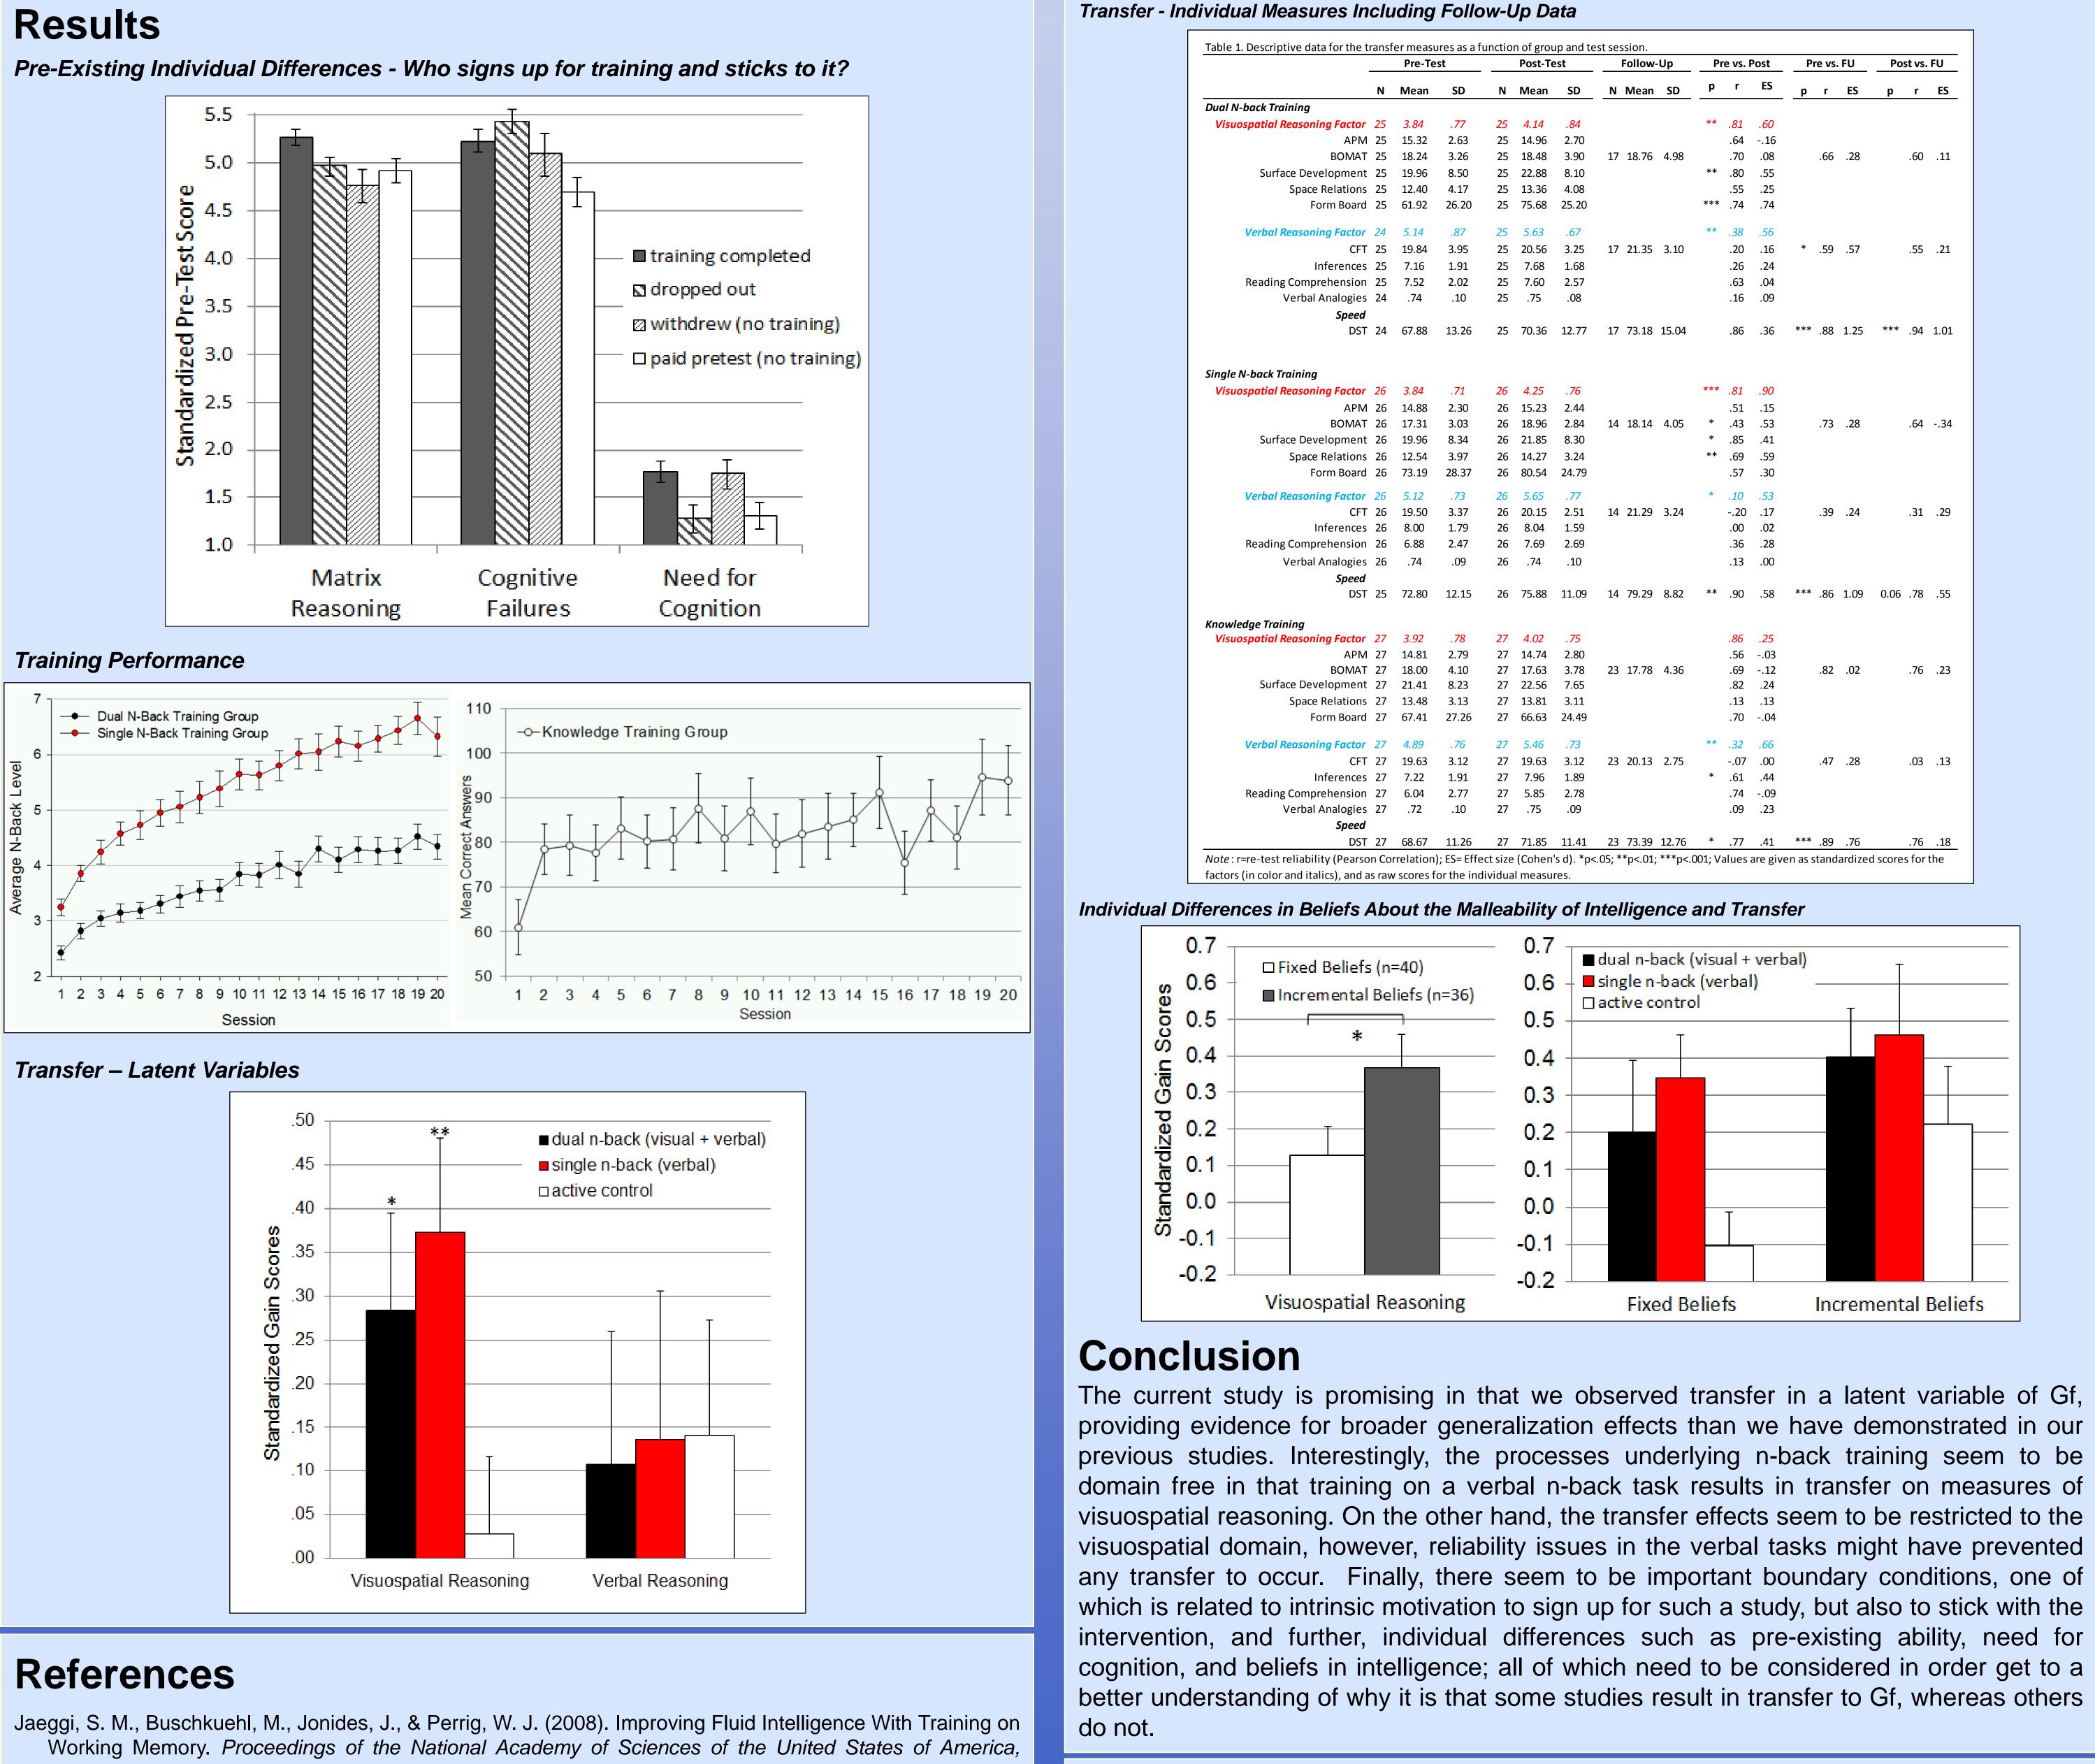

Questionnaires: Beliefs in Intelligence, Need for Cognition, Cognitive Failure Questionnaire

## **Transfer Measures:**

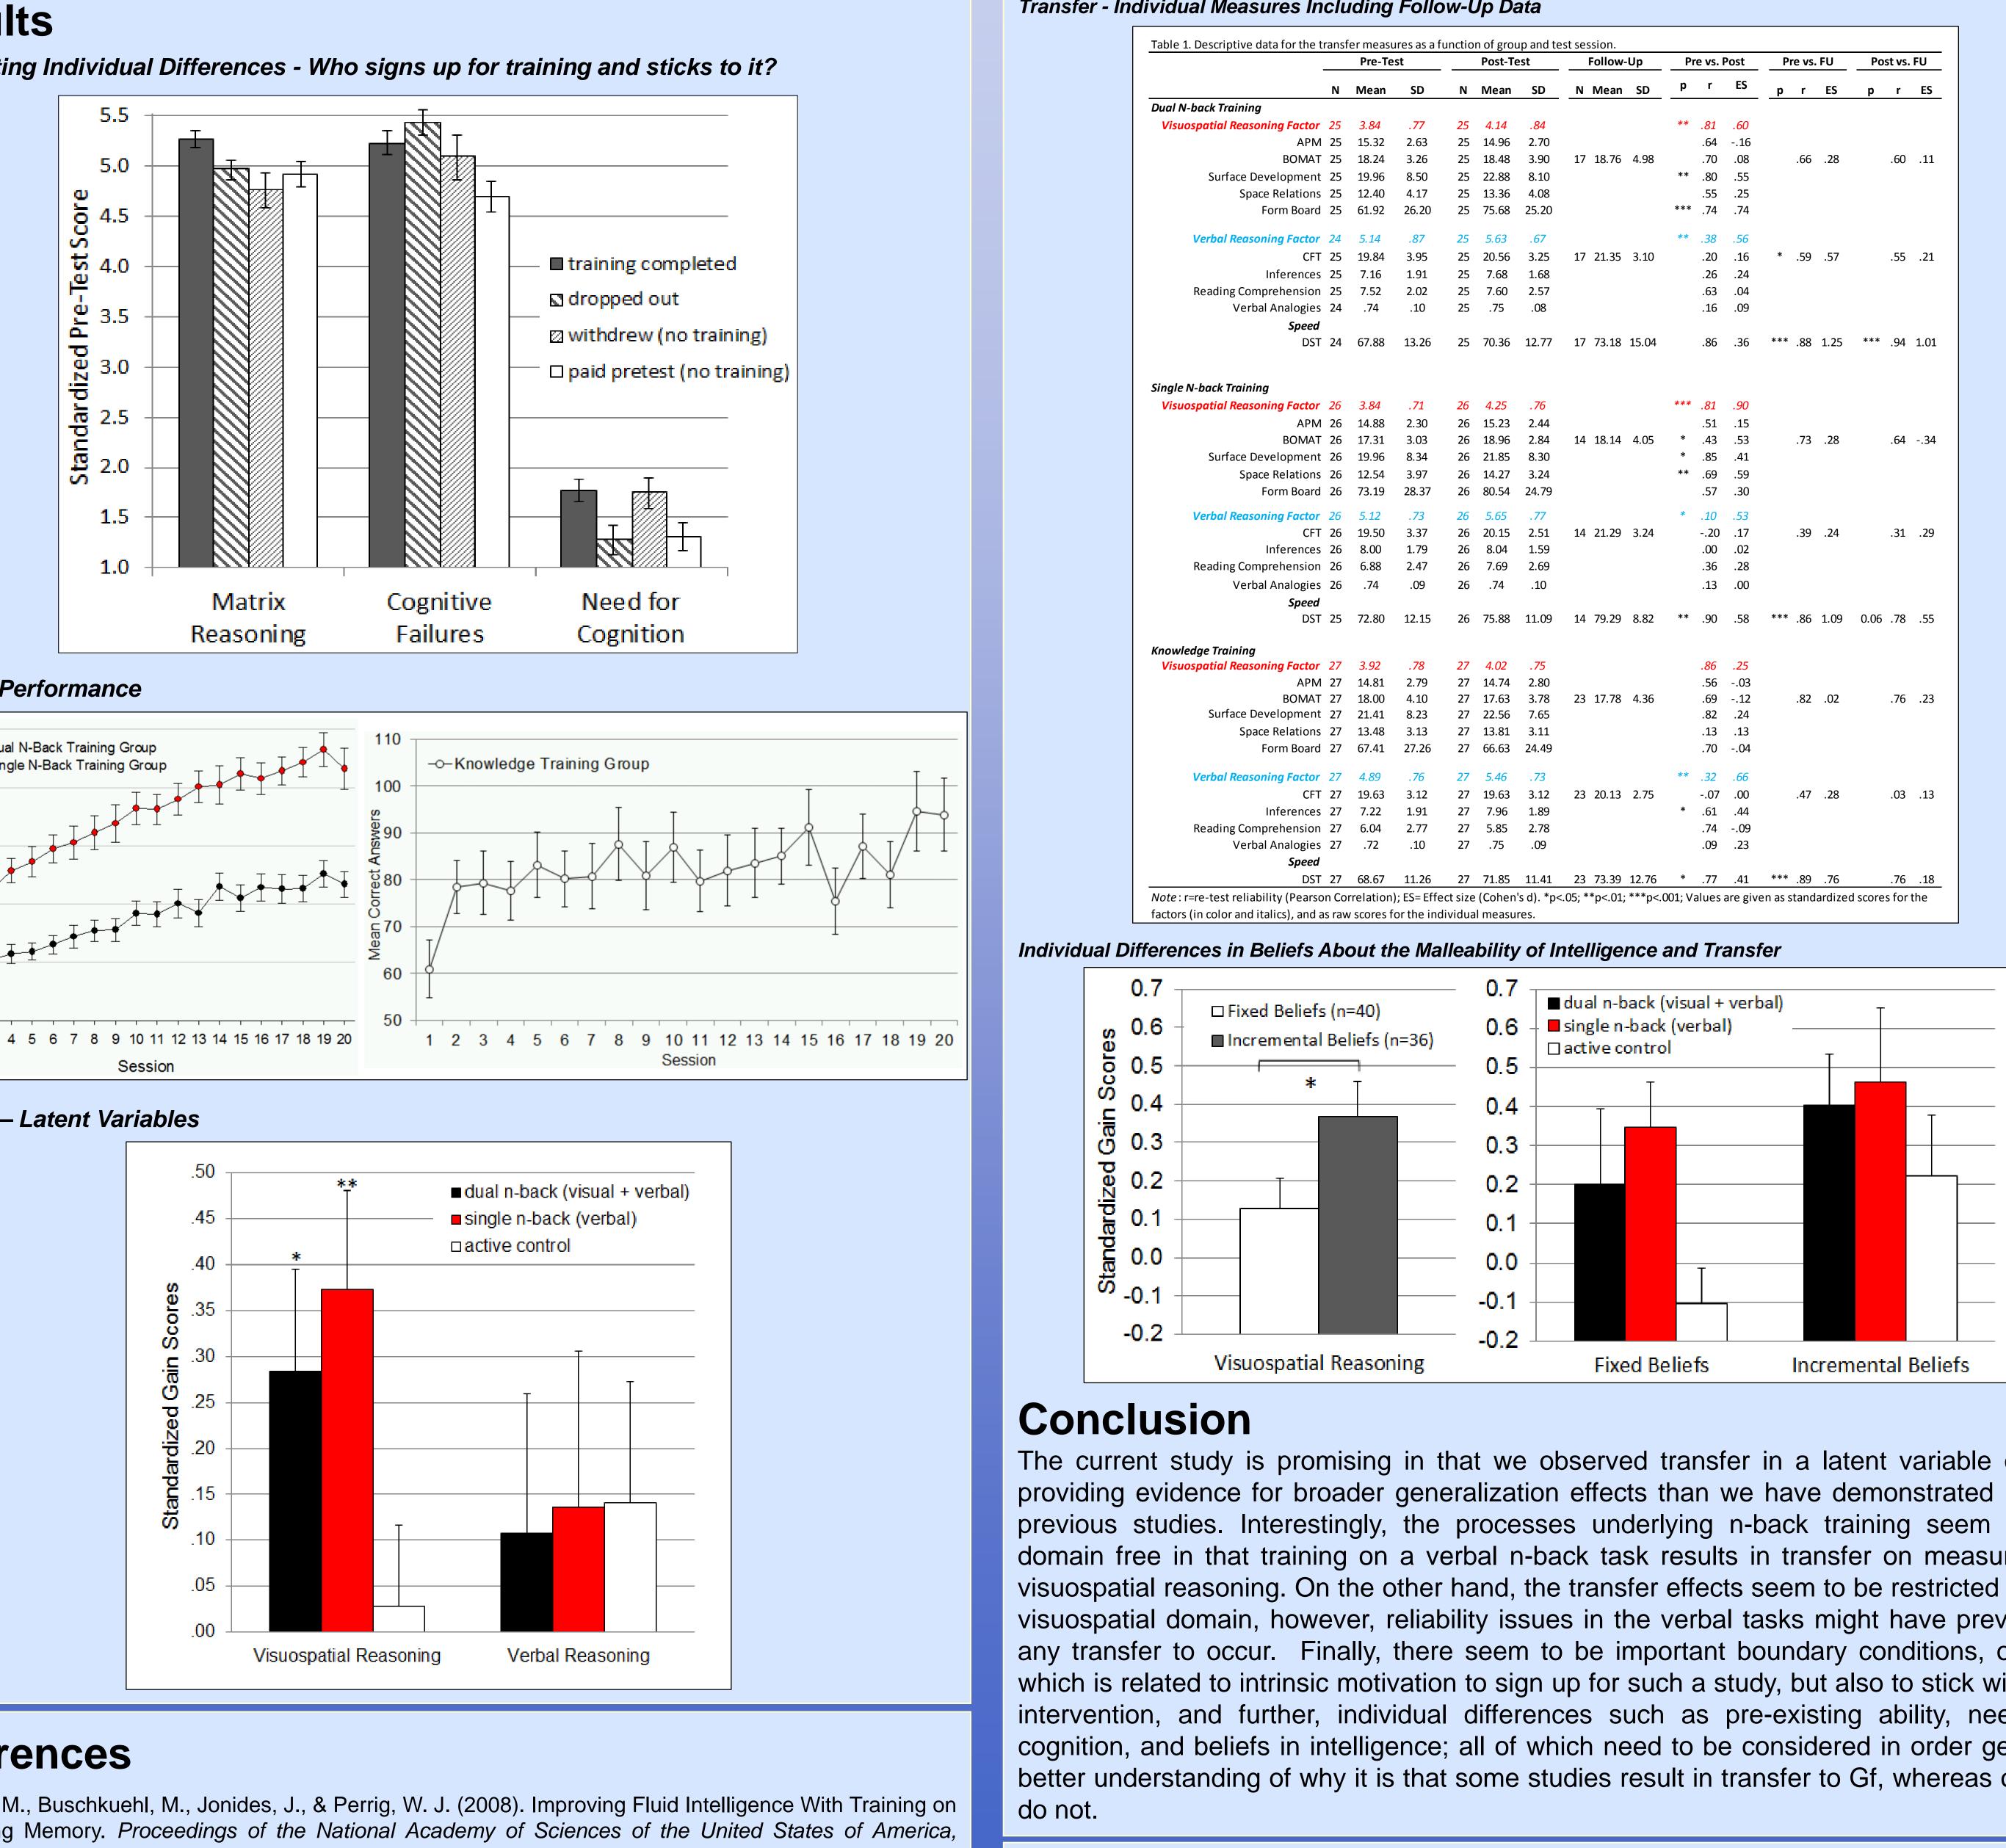

| Matrices Tasks (untimed): | Visual Tasks (timed):   | Verbal Tasks (timed):  |  |  |  |  |  |  |
|---------------------------|---|--|--|--|--|--|--|--|
| - Raven's APM             | - Surface Development   | - Inferences   |  |  |  |  |  |  |
| - BOMAT                   | - Form Board  | - Reading Comprehension  |  |  |  |  |  |  |
| - Cattell's CFT           | - Space Relations   | - Verbal Analogies   |  |  |  |  |  |  |
|                           | Factor 1<br>(30% explained variance)                            | Factor 2<br>(30% explained variance)   |  |  |  |  |  |  |
| • S<br>• S                | PM<br>OMAT<br>urface Development<br>pace Relations<br>orm Board | <ul> <li>CFT</li> <li>Inferences</li> <li>Reading Comprehension</li> <li>Verbal Analogies</li> </ul> |  |  |  |  |  |  |
|                           | Visuospatial Factor   | ⇒ Verbal Factor  |  |  |  |  |  |  |
|                           | Note: DST did not load on either factor.                        |  |  |  |  |  |  |  |

# Working Memory Training and Transfer to Gf: **Evidence for Domain Specificity?**

Presented at the 52<sup>nd</sup> Annual Meeting of the Psychonomic Society, Seattle, WA 2011

105(19), 6829-6833.
